Proposal to Exxon Mobil Corporation

To increase the market value of your company to more than **\$800 billion** within the next two years.

The Proposal

This proposal is independent of any action your company may take, and whether the coal, oil and gas prices are 20% or 300% of what they are today has no bearing on this proposal either.

1. You fund a new organisation called H3 with a \$20 million loan.
2. The first two actions of this organisation are to implement a plan to stabilise the global economy via something called the **CNGE Initiative**, and to implement a completely **different approach to Climate Change**, and this second one is where the increase in your market value occurs.
3. This approach to Climate Change contains five major initiatives, and the ANSR reform is specifically designed to get you and other fossil fuels companies onboard.
4. The details are contained in the **Climate Change discussion paper**, but the shorthand of how the ANSR reform impacts fossil fuels companies, is that it delivers replacement commerce for the fossil fuels income you'll be giving up as we wean ourselves off fossil fuels at an accelerated rate. The money to do this does NOT come from governments or from any other current source.
5. Because of the dynamics of this situation, it will be viewed as and is reasonable to provide replacement commerce worth twice the peak market value of your company over the last five years.
6. Because of the need to slightly overestimate when apportioning the replacement commerce, what this means for your company is replacement commerce worth about **\$800 billion**, with significant growth opportunities on top of that.
7. At this point there are over twenty major commerce options to choose from worth well in excess of \$15 trillion; so in other words, there's more than enough.
8. Repayment of the loan plus interest occurs within six months due to H3 funding going through the roof as we move through the process.

The context

The H3 organisation has been under development for just over twenty years, and it contains a suite of global economic reforms that are designed to solve many of our biggest problems, but it does it in such a way so that those with all the money and power in this world, the dyed in the wool capitalists, will be even more keen to implement them than greenies and altruists (it's the only way solutions to major problems will ever be adopted, don't you agree). There are a number of **books** I've written to accompany this launch, and there is at least a trillion dollars worth of **proof of substance** I've also made available.

The process

1. We push forward something called the **CNGE Initiative**. It is a plan to stabilise the global economy by creating a new central bank for the world to replace the \$40 trillion lost or expended during COVID. The way we push it out is with a big shock

announcement all over the world and everything ready to implement in that moment, which will have the impact of putting governments, corporations, and the general public in the mindset of “waiting for Christmas morning”. It will have this effect because most major economies are “biting their nails” over the widely expected major downturn in the global economy, which this would avert, and because this is something we can do that fits inside the rules.

2. This will obviously create a huge profile splash for the H3 organisation. I assume we can agree that something like this (with its shock value, expectation, and global rollout) will create one of the biggest noises of the year????
3. On the same day we do the ‘big shock announcement’ for the CNGE Initiative, we also insert full page notices in major newspapers all over the world for the **H3 approach to Climate Change**. This, from the same organisation, will add to the ‘shock value’.
4. As we’re going through the process for the CNGE Initiative, the H3 organisation will be funded through the roof courtesy of the profile splash, the substance in the H3 approach to Climate Change, the books, and the rather significant “blue sky”.
5. After we implement the CNGE Initiative, we immediately move to fix Climate Change at the same time as we start to ramp up H3 operations.
6. As soon as H3 funding goes past \$400 million, I pay you back the loan and whatever interest you deem reasonable. This could take two months or it could take six months; it won’t take longer than that.
7. If things go roughly according to plan over the next two years then the value of **Exxon** will be hovering around the **\$800 billion** mark long before this point.
